

Updated Version Numbering Scheme and Release Planning

Open MPI Project

June 2015

Table of contents

- These slides cover several related topics:
 1. Open MPI's new version numbering scheme
 2. Transition plan to the new version numbering
 3. Release planning roadmap
 4. The bottom line (TL;DR)
- Let's jump right in...

Before July 2015...

- Open MPI used an “odd / even” numbering scheme
 - 1.odd: “feature” series
 - 1.even: “stable” series
- But it’s not working out as well as we’d like

One problem

- Very few users actually use the “odd” versions
 - Users equate “odd” with “unstable”
- As a direct result:
 - New features don’t get real-world tested
 - ...until the “even” releases

Another problem

- Users want new features faster
 - A “stable” series (intentionally) does not receive new features
- As a direct result:
 - New features take a long time to get to users

Let's fix that

Goodbye odd / even scheme!

New version numbering scheme

- Open MPI will (continue to) use a “A.B.C” version number triple
- Each number now has a specific meaning:
 - A** This number changes when backwards compatibility breaks
 - B** This number changes when new features are added
 - C** This number changes for all other releases

Examples

- Pretend we're in the future
 - The current Open MPI release is **v3.4.2**
- What will be the next release number?
- Let's look at a few cases...

Example 1

- Current release: v3.4.2
- Situation:
 - Bugs are fixed
 - No new features are added
 - Backwards compatibility is preserved

→ Next release will be v3.4.3

Example 2

- Current release: v3.4.2
- Situation:
 - Bugs are fixed
 - User-noticeable new features are added
 - Backwards compatibility is preserved

→ Next release will be v3.5.0

Example 3

- Current release: v3.4.2
- Situation:
 - Major changes occur (new features, etc.)
 - Backwards compatibility is broken

→ Next release will be v4.0.0

Wait...

How exactly are you defining the term

**“backwards
compatibility”**

?

Definition

- Open MPI vY is backwards compatible with Open MPI vX (where Y>X) if:
 - Users can compile a correct MPI / OSHMEM program with vX
 - Run it with the same CLI options and MCA parameters using vX or vY
 - The job executes correctly

What does that encompass?

- “Backwards compatibility” covers several areas:
 - Binary compatibility, specifically the MPI / OSHMEM API ABI
 - MPI / OSHMEM run time system
 - `mpirun` / `oshrun` CLI options
 - MCA parameter names / values / meanings

How will I know when backwards compatibility breaks?

- Two ways:
 1. The first digit of the Open MPI version number changes
 2. Read the NEWS file
 - When the first digit of the version number changes, NEWS will contain a list of what issues broke backwards compatibility

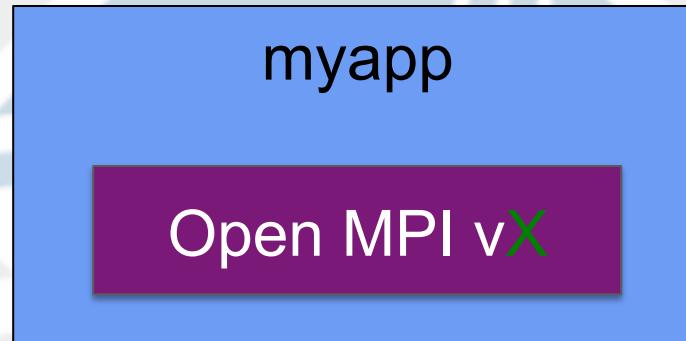

Versioning note

- Open MPI only supports running exactly the same version of the runtime and MPI / OSHMEM libraries in a single job
 - If you mix-n-match different versions in a single job...

Versioning: beware of static builds!

- When an MPI app is statically linked, it is “locked” to a specific version of Open MPI
 - `mpicc myapp.c -static -o myapp`

- It is erroneous to `mpirun` with a different version (e.g., `mpirun vY`)

Transition to the New Version Numbering Scheme

How to move to the new numbering?

How to move to the new numbering?

What's next?

v1.8.6

Released
June 19, 2015

How to move to the new numbering?

What's next?

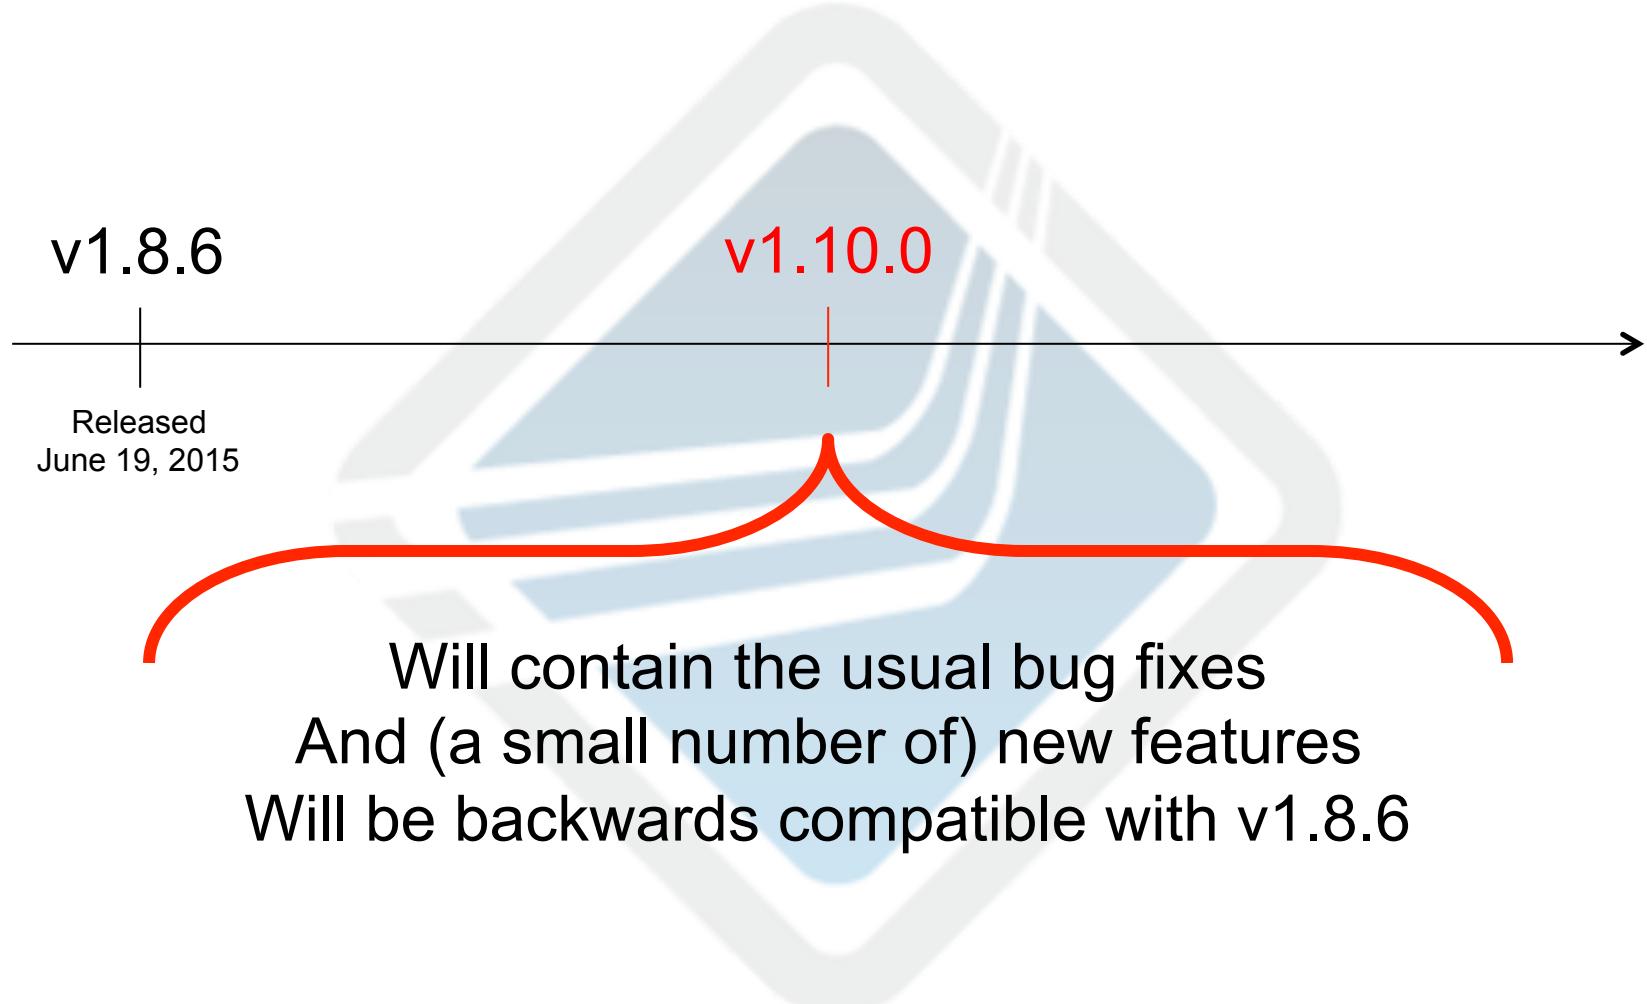

v1.8.6

Released
June 19, 2015

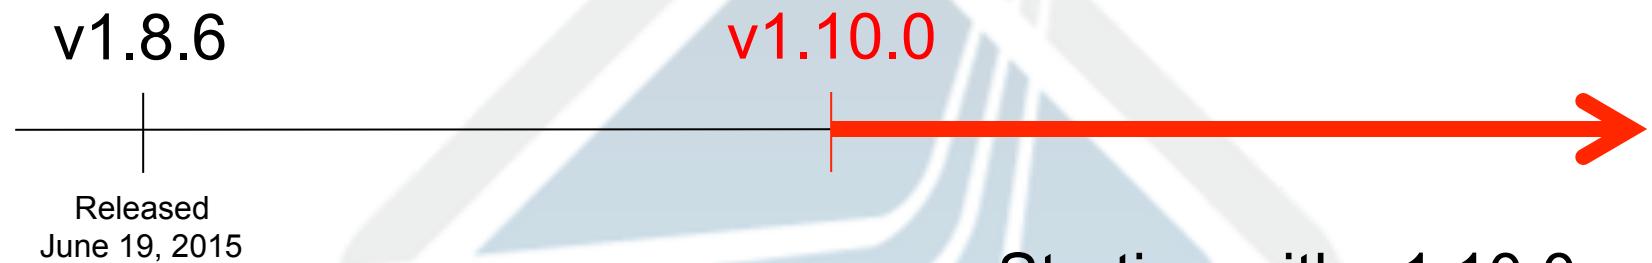

Note: it would be crazy confusing
to change the version number scheme
in the middle of the v1.8.x series.

We won't be doing that.

How to move to the new numbering?

How to move to the new numbering?

Starting with v1.10.0,
future releases
will abide by the
new versioning
scheme

Release Planning Roadmap

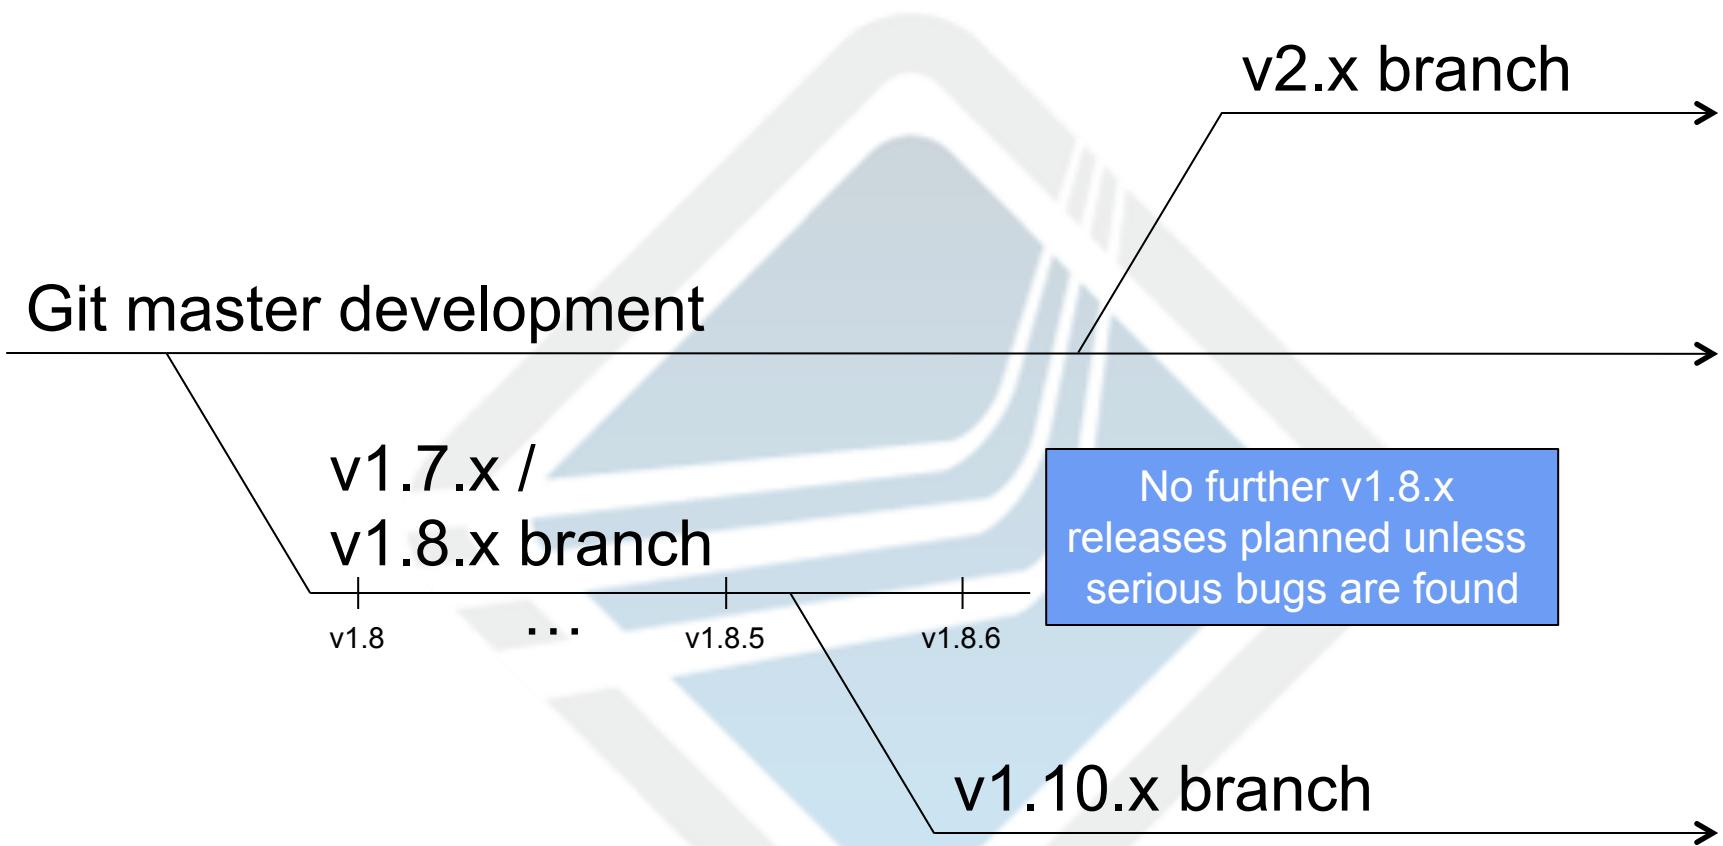

What's next?

- We are planning for v1.10.0
 - Within the next few months
 - Contains the usual bug fixes and minor improvements (over v1.8.6)
 - Also contains a small number of new features
 - libfabric support
 - Mellanox Yalla PML
 - Intel PSM2 for OmniPath

What's next?

- We anticipate **v2.0.0**
 - Later this year
 - Will contain larger new features
 - Will not be backwards compatible with v1.10.x

Transition definition for the technically inclined

Why “v1.10.0” (vs. “v1.9.0”)?

- 1.** Before June 2015, we referred to the next major release as the “v1.9 series”
 - “v1.10.0” clearly distinguishes from that idea
 - “v2.0.0” conveys a significant difference (i.e., a major new release series)
- 2.** It will take a while for the new scheme to become common knowledge
 - We didn’t want users to think “v1.9” = “odd” = “unstable”

What's the plan over time?

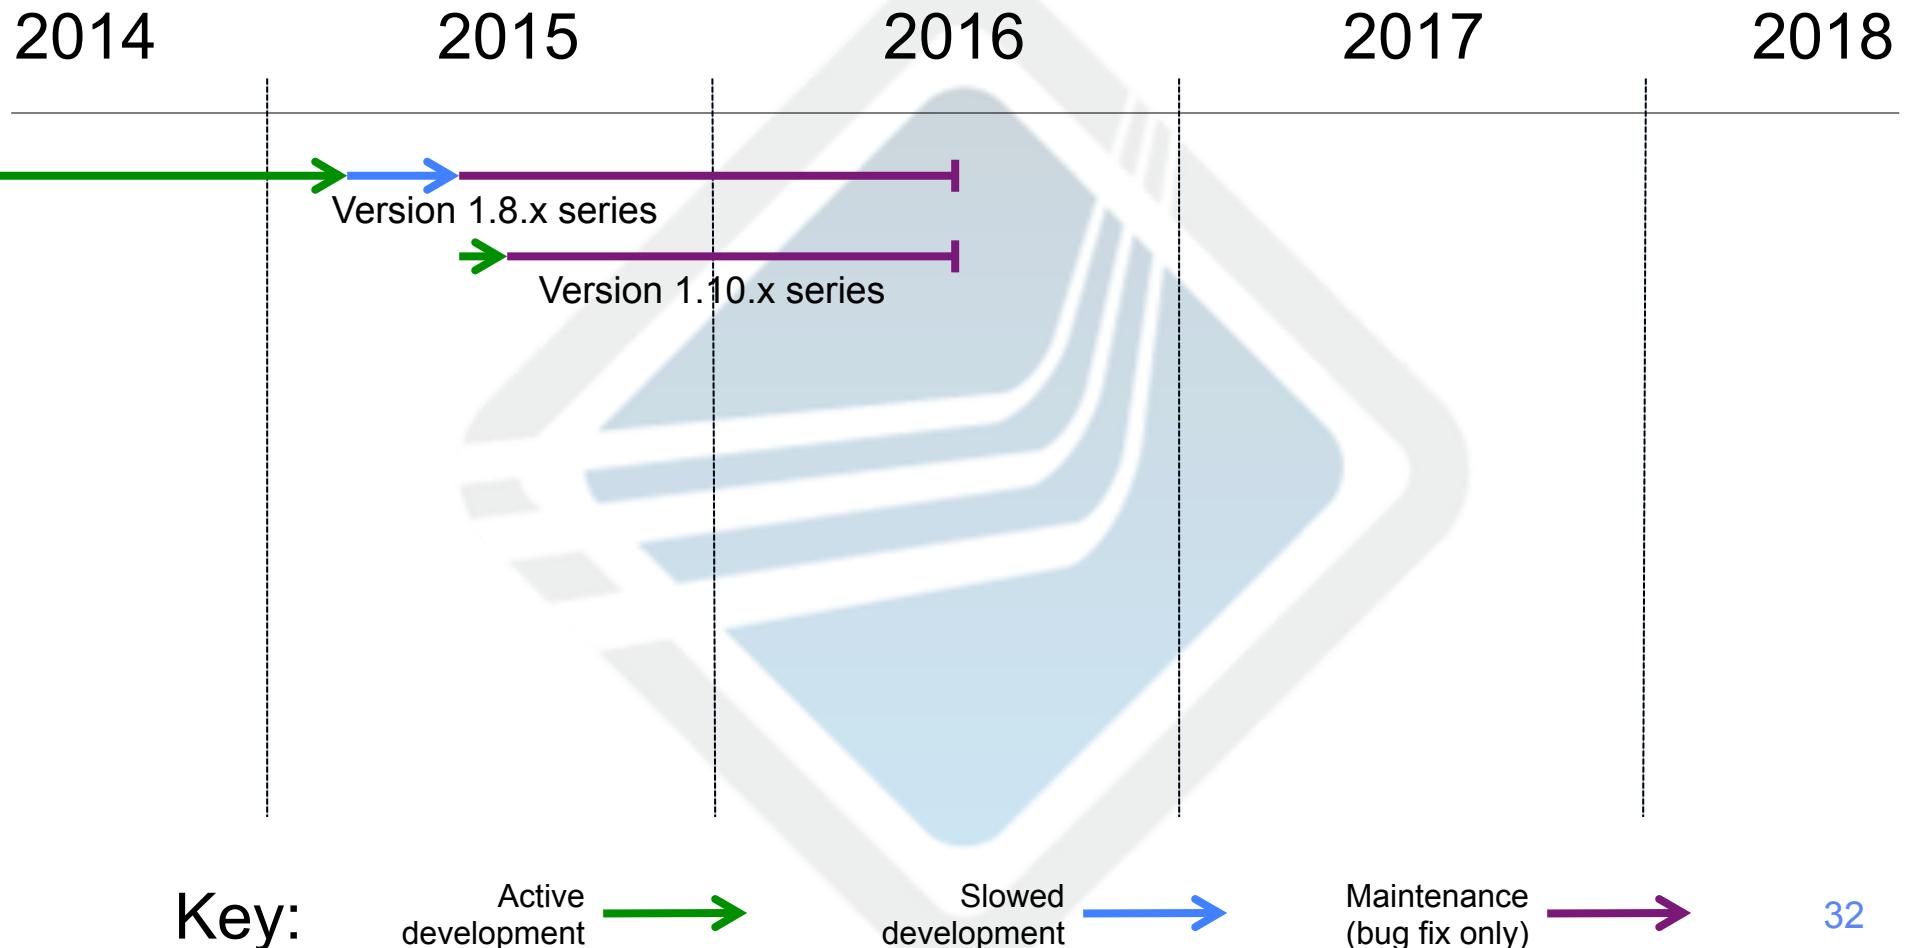

- Plan for a new release series once a year
 - v2.x: release in mid / late 2015
 - v3.x: release in mid / late 2016
 - v4.x: release in mid / late 2017
 - ...etc.

NOTE: Scheduled releases is a new concept for the Open MPI developer community. We'll continue to evaluate this plan over time.

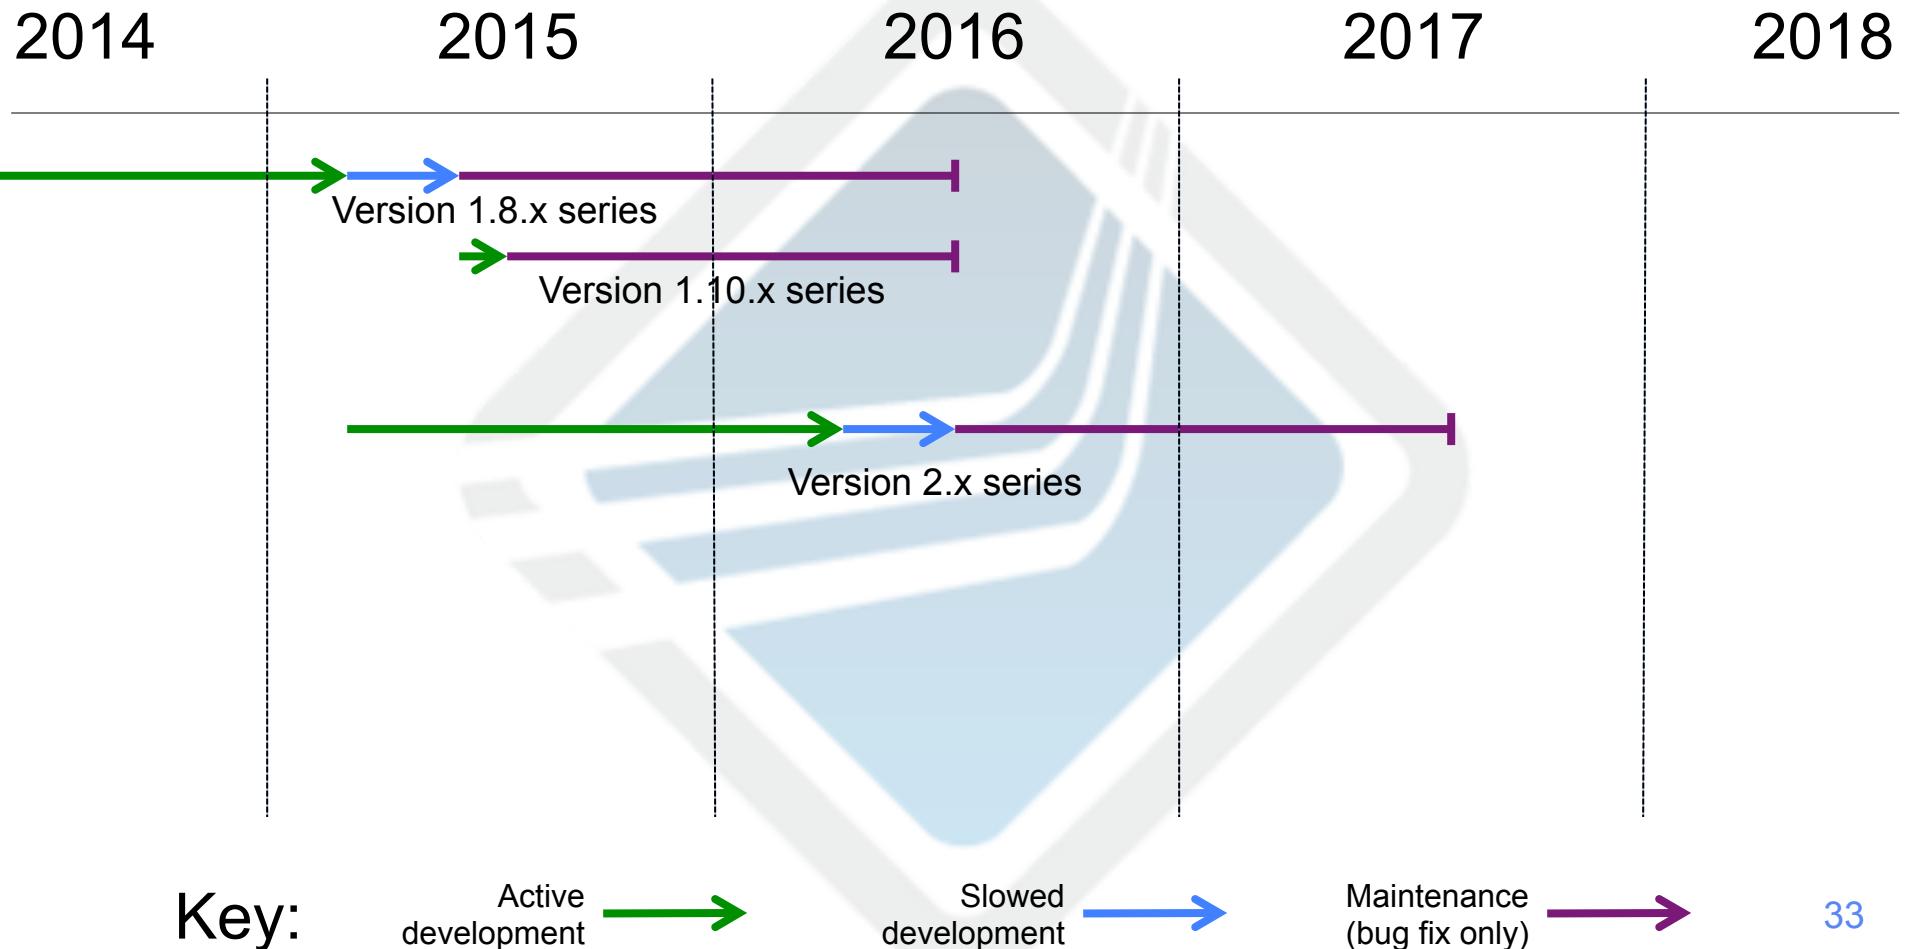

What will be supported?

- (Continue the) Support “current version and one prior” philosophy
 - Mid 2015 – mid 2016
 - Support v1.10.x, and v2.x
 - Special case for the transition: **also support v1.8.x**
 - Mid 2016 – mid 2017
 - Support v2.x and v3.x
 - Mid 2017 – mid 2018
 - Support v3.x and v4.x
 - ...etc.

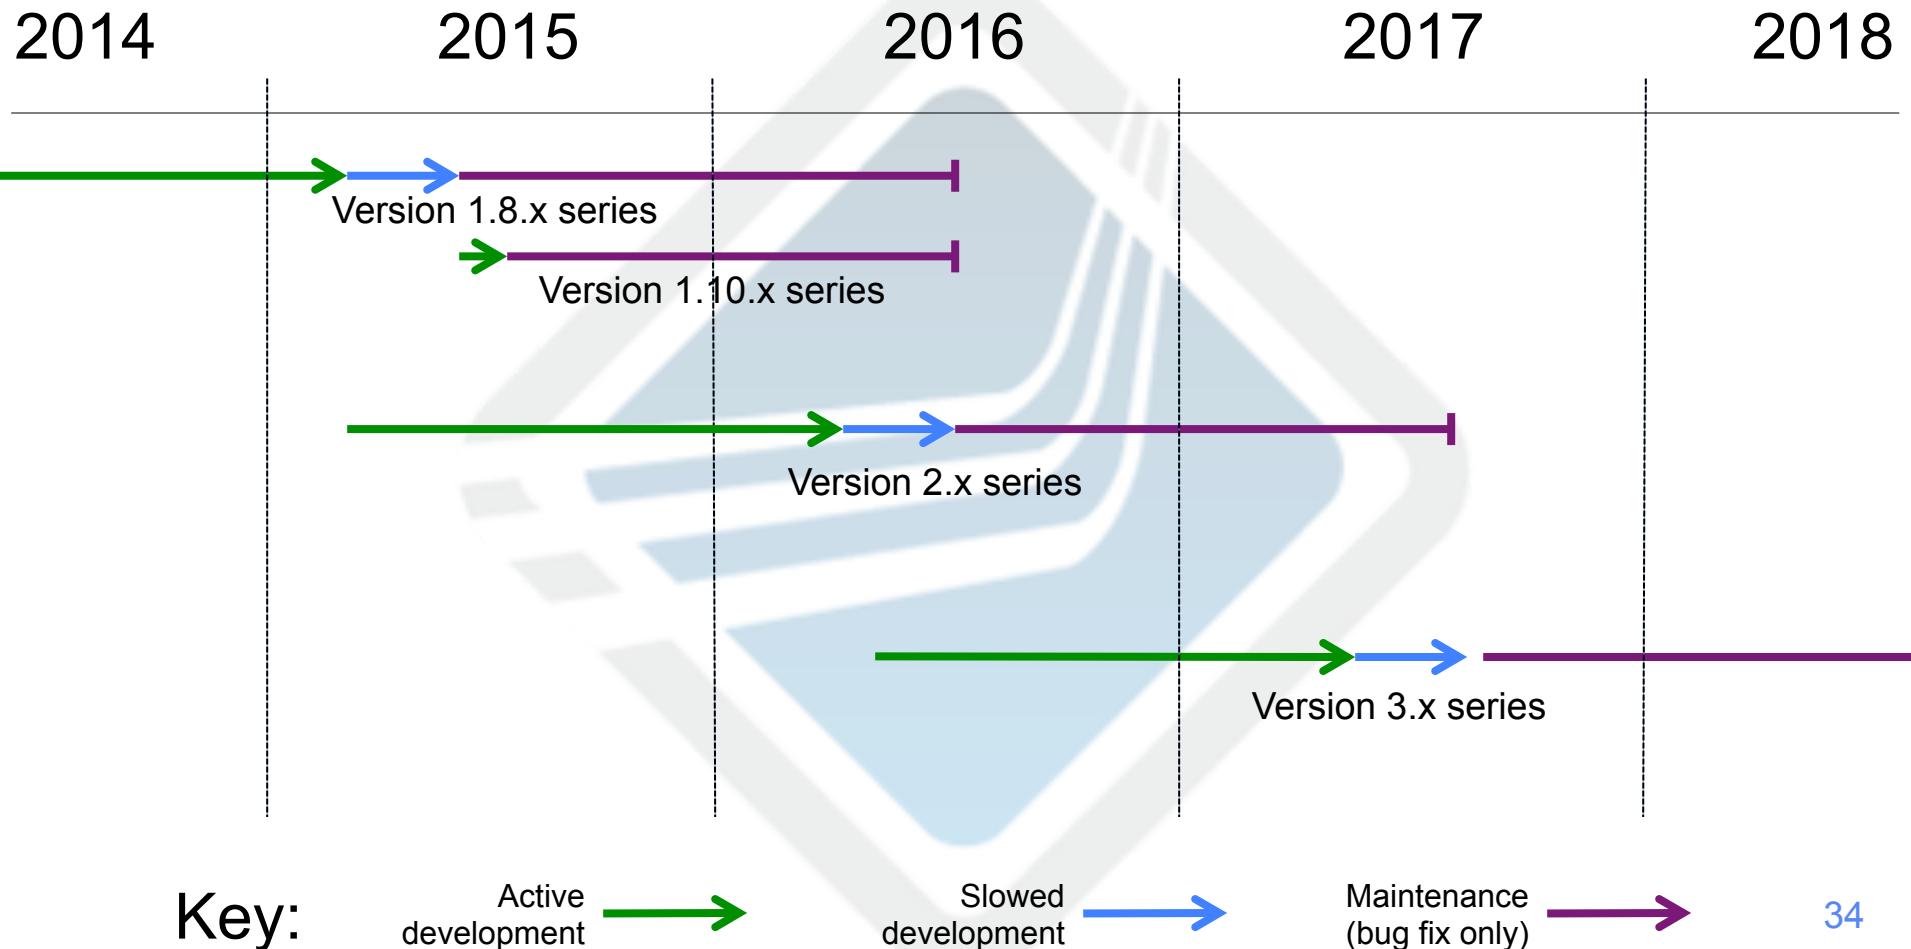

Planned development and support cycle

Planned development and support cycle

Planned development and support cycle

The Bottom Line

The bottom line

- Starting with v1.10.0:
 - No more odd/even series
 - “A.B.C”: each number has a specific meaning
 - Read the NEWS file when “A” changes
 - Release new features faster
- Aim to limit life release series
 - ~1 year of devel + ~1 year of bug fixes
